14:
           return C_1, \ldots, C_k
15:
```

In the lines 4 and 9 of the pseudocode we pick as a single i in the case that the armin is not unique.

■ Page 57, Line 7:

$$\mu(A) \in \operatorname*{argmin}_{\mu \in A} \sum_{x \in A} \rho(x,\mu)^2, \quad \text{respectively} \quad \mu(A) \in \operatorname*{argmin}_{\mu \in \textbf{X}} \sum_{x \in A} \rho(x,\mu).$$

■ Page 57, Line -7: For  $j \ge 1$  denote by  $(C_1^{(j)}, \ldots, C_k^{(j)})$  that clustering which the algorithm produces in the j-th round. For  $j \ge 2$  we have

$$K(C_1^{(j)}, \dots, C_k^{(j)}) = \min_{\mu_1, \dots, \mu_k \in \mathbf{X}} \sum_{i=1}^k \sum_{x \in C_i^{(j)}} \rho(x, \mu_i)^2$$

- Page 58, Line 3: ...line 11 of Algorithm 4.9 ...
- Page 58, Line 7: There, Picture 1b corresponds to the penultimate line in the estimate and Picture 2a to the line above that.
- Page 58, Line 10: ... as we have just moved point  $x_3$  from cluster  $C_2$  in Figure 1b to cluster  $C_1$  in Figure 2a, ...
- Page 59, Line -4: We assume that we start with the initial values  $\mu_1 = 2$  and ...
- Page 62, Line 11:  $A = (a_{ij})_{i,j=1,...,r}$
- Page 62, Line 13:  $L = (\ell_{ij})_{i,j=1,...,n}$
- Page 63, Line -2: ... In Example 5.7,  $\lambda_2 \neq 0$  and there are no clusters (or, depending on how one prefers to see it, one single cluster), in Example 5.8 ...
- Page 67, Line 8: For the other direction let  $\{v_1, \ldots, v_n\}$  be a basis consisting of eigenvectors corresponding to the  $\lambda_i$  and let  $U \subseteq \mathbb{R}^n$  be a subspace with dim U = n k + 1. By construction  $U \cap \text{span}\{v_1, \ldots, v_k\} \neq \{0\}$  and we can select  $0 \neq x = \alpha_1 v_1 + \cdots + \alpha_k v_k \in U$ . Then it follows

$$\frac{\langle x, Mx \rangle}{\langle x, x \rangle} = \frac{\sum_{i=1}^{k} \lambda_i \alpha_i^2}{\sum_{i=1}^{k} \alpha_i^2} \leqslant \frac{\lambda_k \sum_{i=1}^{k} \alpha_i^2}{\sum_{i=1}^{k} \alpha_i^2} = \lambda_k,$$

since the  $\lambda_i$ 's are increasing. With this we get  $\min_{0 \neq x \in U} \frac{\langle x, Mx \rangle}{\langle x, x \rangle} \leq \lambda_k$  which then leads to

$$\max_{\substack{U \subseteq \mathbb{R}^n \\ \text{dim}(U, x)}} \min_{\substack{x \in U \\ x \neq 0}} \frac{\langle x, Mx \rangle}{\langle x, x \rangle} \leqslant \lambda_k.$$

- Page 67, Line -4: ... and any corresponding eigenvector  $v_2$  of norm 1:

■ Page 74, Line -3 (until top of page 75):

$$\lambda_{2} = \frac{\sum_{\{i,j\} \in E} (x_{i} - x_{j})^{2}}{\sum_{i=1}^{n} x_{i}^{2} d_{i}}$$

$$\geqslant \frac{\sum_{\{i,j\} \in E} ((p_{i} - p_{j})^{2} + (n_{i} - n_{j})^{2})}{\sum_{i=1}^{n} (p_{i}^{2} + n_{i}^{2}) d_{i}}$$

$$= \frac{\sum_{\{i,j\} \in E} (p_{i} - p_{j})^{2} + \sum_{\{i,j\} \in E} (n_{i} - n_{j})^{2}}{\sum_{i=1}^{n} p_{i}^{2} d_{i} + \sum_{i=1}^{n} n_{i}^{2} d_{i}}$$

$$\geqslant \min\left(\frac{\sum_{\{i,j\} \in E} (p_{i} - p_{j})^{2}}{\sum_{i=1}^{n} p_{i}^{2} d_{i}}, \frac{\sum_{\{i,j\} \in E} (n_{i} - n_{j})^{2}}{\sum_{i=1}^{n} n_{i}^{2} d_{i}}\right)$$

$$= \min\left(\frac{\sum_{\{i,j\} \in E} (p_{i} - p_{j})^{2}}{\sum_{i=1}^{n} p_{i}^{2} d_{i}} \cdot \frac{\sum_{\{i,j\} \in E} (p_{i} + p_{j})^{2}}{\sum_{\{i,j\} \in E} (p_{i} + p_{j})^{2}}, \dots\right)$$

$$=: \min\left(\frac{Z}{N}, \dots\right).$$

■ Page 75, Line 8:

$$N = \sum_{i=1}^{n} p_i^2 d_i \cdot \sum_{\{i,j\} \in E} (p_i + p_j)^2 \geqslant \sum_{\substack{\uparrow \\ (5,5)}}^{n} \sum_{i=1}^{n} p_i^2 d_i \cdot \sum_{\{i,j\} \in E} 2(p_i^2 + p_j^2)$$

■ Page 76, Line 3:

$$\cdots = \int_{\text{telescopic}} \left( \sum_{i=1}^{n-1} \sum_{j=i+1}^{n} \mathbb{1}_{E}(i,j) \sum_{k=i}^{j-1} \left( p_k^2 - p_{k+1}^2 \right) \right)^2$$

- Page 79, Line 13: Finally, we want to note that Theorem 5.21 together with Remark 5.17(i) provides an upper bound for the eigenvalue  $\lambda_2(\mathcal{L})$ .
- Page 82, Line -5: Let a dataset  $D = \{x_1, \ldots, x_n\} \subseteq \mathbb{R}^d$  be given, ...
- Page 83, Line 3:

$$\sum_{j=1}^{k} \|Xv_j\|^2 \geqslant \sum_{j=1}^{k} \|Xw_j\|^2$$

■ Page 83, Line -8:

$$\{v_1, \dots, v_k\} \in \operatorname*{argmax}_{\substack{\{ ilde{v}_1, \dots, ilde{v}_k\} \subseteq \mathbb{R}^d \ ext{orthonormal}}} \sum_{j=1}^n \|X ilde{v}_j\|^2.$$

- Page 84, Line 10: Let  $D = \{x_1, \ldots, x_n\} \subseteq \mathbb{R}^d$  be given ...
- Page 84, Line 13: for j = 1, ..., k, where ...
- Page 85, Line -1:  $\langle \boldsymbol{w_{k+1}}, v_i \rangle = \langle \boldsymbol{w_{k+1}}, \underbrace{v_i \pi_W(v_i)}_{+W} \rangle + \langle \boldsymbol{w_{k+1}}, \underbrace{\pi_W(v_i)}_{\in U} \rangle = 0 + 0 = 0$
- Page 86, Line 11: Let  $D = \{x_1, \ldots, x_n\} \subseteq \mathbb{R}^d$  be given...
- Page 87, Line −9: Determine, by using Theorem 6.3 and a Python package for maximizations under nonlinear constraints, a 1-best fitting subspace for ...
- Page 86, Line 16: ... hold if  $r = \dim \operatorname{span} D > 0$ . If r = 0, then all  $\sigma_k$  vanish.
- Page 86, Line 19: For  $k \ge r+1$  we apply the equation in the proof of Lemma 6.2 twice, on the one hand for  $V_k$  with ONB  $\{v_1, \ldots, v_k\}$ , and on the other for  $V_{k-1}$  with ONB  $\{v_1, \ldots, v_{k-1}\}$ . Then, after rearranging, we obtain

$$\sigma_k^2 = ||Xv_k||^2 = \sum_{i=1}^n \operatorname{dist}(x_i, V_{k-1})^2 - \sum_{i=1}^n \operatorname{dist}(x_i, V_k)^2.$$

As  $V_r \subseteq V_{k-1} \subseteq V_k$  holds, Lemma 6.4 implies that both terms on the right hand side are zero. Thus,  $\sigma_{r+1}, \ldots, \sigma_d = 0$ .

- Page 90, Line 8:  $||u||^2 = ||Av||^2 = \langle Av, Av \rangle = \cdots$
- Page 94, Line 6: ..., it may be easier to start with this matrix and proceed analologuously (notice that one then gets the  $u_i$ 's first and has to compute the  $v_i$ 's by applying  $A^{\mathrm{T}}$ ).
- Page 94, Line -9:  $V \in \mathbb{R}^{d \times d}$
- Page 94, Line -7: Then precisely r-many of the  $\sigma_i$  are nonzero and these are the singular values of A...
- Page 96, Line 10: ... and let  $\{v_1, \ldots, v_r\}$  be some arbitrary orthonormal system ...
- Page 96, Line 14: By construction, the  $v_1, \ldots, v_r$  that we defined in the theorem form an orthonormal system.
- Page 96, Line 20:

$$||Av||^2 = \langle v, A^{\mathsf{T}}Av \rangle = \langle v, B \operatorname{diag}(\cdots)B^{\mathsf{T}}v \rangle = \langle B^{\mathsf{T}}v, \operatorname{diag}(\cdots)B^{\mathsf{T}}v \rangle = \sum_{j=1}^r \lambda_j^2 (B^{\mathsf{T}}v)_j^2$$

In the rest of the proof everywhere the squares at the eigenvalues  $\lambda_i$  have to be removed!

- Page 98, Line 4: ... $v_i$  is therefore an eigenvector of  $A^TA$  corresponding to  $\sigma_i^2$  for i = 1, ..., k.
- Page 99, Line -3: Multiplication with  $V^{\rm T}$  from the left in
- Page 99, Line 12:  $v = \begin{bmatrix} 0 \\ \vdots \\ 0 \\ \frac{\sigma_{k+1}}{w_{k+1}} \end{bmatrix} / \left\| \begin{bmatrix} 0 \\ \vdots \\ 0 \\ \frac{\sigma_{k+1}}{w_{k+1}} \end{bmatrix} \right\|$
- Page 99, Line 14: ..., we want to discuss how the singular value decomposition indeed generalizes the orthogonal diagonalization theorem.

- Page 99, Line 16: **Proposition 7.14.** Let  $A \in \mathbb{R}^{n \times n}$  be a symmetric and positive semi-definite matrix, . . .
- Page 99, Line -3: Proposition 7.14 thus yields exactly an orthogonal diagonalization  $V^{T}AV = \text{diag}(\sigma_{1}, \ldots, \sigma_{r}, 0, \ldots, 0)$ ; but only under the additional assumption of A being positive semidefinite.

Corollary 5.22. Let G = (V, E) be a graph with  $\deg(i) > 0$  for all  $i \in V$ . Then for the second smallest eigenvalue  $\lambda_2$  of the normalized Laplace matrix of G the estimate  $\lambda_2 \leq 2$  holds.

■ Page 102, Line 17: Proof. Let  $B \in \mathbb{R}^{n \times d}$  be arbitrary. Put

$$V_k := \operatorname{span}\{v_1, \dots, v_k\}$$
 and  $W := \operatorname{span}\{b_1, \dots, b_n\}$  and  $\check{V} := \operatorname{span}\{\check{a}_1, \dots, \check{a}_n\}$ ,

where  $b_i \in \mathbb{R}^d$  is the vector that has as entries those of the *i*-th row of B. According to Theorem 7.12,  $V_k$  is a k-best fitting subspace for  $\{a_1, \ldots, a_n\}$ . We claim that  $\check{V} = V_k$ . By Theorem 7.17(ii), we have  $\check{a}_i \in V_k$  for  $i = 1, \ldots, n$  and thus  $\check{V} \subseteq V_k$ . The equality then follows from  $\dim \check{V} = \operatorname{rk} \check{A} = k = \dim V_k$ . Consequently we obtain for each  $i = 1, \ldots, n$  the estimates

$$||A - B||_{F}^{2} = \sum_{i=1}^{n} ||a_{i} - b_{i}||^{2} \underset{b_{i} \in W}{\geqslant} \sum_{i=1}^{n} ||a_{i} - \pi_{W}(a_{i})||^{2} \underset{V_{k} \text{ k-best fitting for } a_{1}, \dots, a_{n}}{\uparrow} ||a_{i} - \pi_{V_{k}}(a_{i})||^{2}$$

$$= \sum_{\substack{i=1 \\ \text{Thm} \\ 7.17(ii)}}^{n} ||a_{i} - \check{a}_{i}||^{2} = ||A - \check{A}||_{F}^{2}$$

which concludes the proof.
